

Twitter Analytics Dashboard Report (Power BI)

Project Title:

Twitter Analytics Dashboard using Power BI

Objective:

To create a visually interactive dashboard that helps analyze high-impression tweets based on engagement metrics like likes, media views, clicks, tweet length, and more. The goal is to identify what type of content drives user interaction.

Tools Used:

- Power BI - Data visualization and report building
- Twitter Dataset (CSV/API) - Raw data for analysis

Key Dashboard Components and Insights:

1. Click Type Proportion for High-Impression Tweets (Pie Chart):

- URL Clicks - 49.26%
- User Profile Clicks - 45.03%
- Hashtag Clicks - 5.71%
- Insight: Tweets with links generate the highest interaction, followed closely by user profile views, indicating strong interest in tweet authors.

2. Media Views vs. Media Engagements by Tweet (Treemap):

- Purpose: To compare how each tweet performs in terms of visual content consumption and interaction.
- Observation: A few tweets (like the one starting with 'elementum ligula vehicula...') contribute significantly to both media views and engagement, highlighting the importance of certain formats or topics.

3. Engagement Rate & Likes by App Opens (Bar Chart):

Twitter Analytics Dashboard Report (Power BI)

- With App Opens: ~25K likes
- Without App Opens: ~25K likes
- Insight: Engagement remains similar regardless of app opens, but this metric can still be used for deeper behavioral segmentation.

KPI Indicators:

Sum of Likes: 25K

Sum of Tweet Length: 593K

Sum of Engagements: 277K

Sum of Media Engagements: 185K

Sum of Media Views: 267K

- Insight: High engagement volume suggests a strong connection between media use and user interaction. Long tweets also seem to perform well in terms of cumulative impressions.

Conclusion:

- Media content is key to driving engagement on Twitter.
- URL inclusion in tweets is highly effective in attracting clicks.
- Overall engagement patterns are consistent across app open categories, but high media-related figures indicate where strategy should focus.

Recommendations:

- Create more tweets with media content and URLs.
- Experiment with tweet length to test if longer tweets perform better.
- Perform A/B testing based on time of day and topic to further optimize outreach.

Next Steps:

- Add filters for hashtag, tweet date, or impressions range.
- Connect to Twitter API for real-time updates.
- Integrate text sentiment analysis for more granular tweet feedback.
